Bug ID	Module	Bug Description	Steps to Reproduce	Expected Result	Actual Result
BUG-002	Patient Signup	Informational and error alert modals show conflicting 'Yes' and 'Cancel' actions. These actions are unsuitable for simple notifications and make it unclear how the user should dismiss messages such as 'OTP has been sent' or 'Invalid OTP'.	1. Open the patient registration page. 2. Submit valid new signup details to trigger the OTP-sent notification. 3. Observe the modal buttons. 4. Enter an invalid OTP such as 000000 and click Verify OTP. 5. Observe the buttons on the invalid-OTP alert.	Informational and error alerts should provide a single clear action, such as 'OK' or 'Dismiss'. 'Yes' and 'Cancel' should be reserved for genuine confirmation decisions.	The alerts display both 'Yes' and 'Cancel', including on the OTP-sent notification and invalid-OTP error.
BUG-003	Patient Signup	An email address containing consecutive dots in its domain (for example, user@domain..com) passes client-side validation and triggers an unhandled backend HTTP 500 error instead of being rejected as invalid input.	1. Open the patient registration page. 2. Enter qa_test_user@gmail..com in the Email field. 3. Enter a valid 10-digit phone number. 4. Click Sign Up. 5. Inspect the network response and error alert.	The client-side validator should reject consecutive dots in the domain, or the API should return a controlled HTTP 400 Bad Request with a user-friendly validation message.	The email passes the client regex and the backend returns HTTP 500 with a generic API error.
BUG-004	Patient Signup	The promotional banner's 'SignUp For Now ↗' call-to-action links to /practice, sending patients to Practice/Doctor Onboarding instead of keeping them in the patient registration flow.	1. Open the patient registration page. 2. Locate the 'Experience The Future Of Healthcare' banner. 3. Click 'SignUp For Now ↗'.	The CTA should direct users to patient registration or otherwise preserve the patient signup context.	The CTA navigates to /practice, which is the Practice/Doctor Onboarding flow.
BUG-005	Patient Signup	The right-side carousel uses a full viewport height (100vh) while the registration form card is much shorter. This causes a large, visually unbalanced blank area beneath the form on desktop displays.	1. Open the patient registration page on a desktop viewport, such as 1440×900. 2. Compare the height of the form card with the right-side carousel. 3. Inspect the space below the form card.	The form card and carousel should have balanced heights and vertical alignment, without excessive empty space.	The carousel container uses h-screen (100vh) while the form card is approximately 350px tall, leaving about 500px of blank white space beneath the form on desktop.
BUG-008	Patient Signup	Submitting the signup form with both fields empty displays raw red asterisks as part of the validation messages, making the feedback visually untidy.	1. Open the patient registration page. 2. Leave Email and Phone Number empty. 3. Click Sign Up.	Validation messages should display clean, readable text such as 'Email is required' and 'Phone number is required', without stray punctuation.	The messages display as '* Email is required' and '* Phone number is required', with raw red asterisks.
BUG-PL-002	Patient Login / Authentication API	The POST /login authentication API includes internal Node.js stack-trace details in its HTTP 400 response. The response exposes server paths (such as /var/www/), internal function names, and implementation details to unauthenticated clients.	1. Submit a login request with invalid credentials. 2. Inspect the response body for POST /login in the browser network tools or API client. 3. Check whether internal stack-trace and server path details are returned.	Authentication failures should return a sanitized JSON response containing a status/success indicator and a friendly error message, without stack traces or internal infrastructure details.	The response body exposes a server stack trace, including an internal path similar to /var/www/ and backend function details.
BUG-PL-003	Patient Login	Leading and trailing spaces in the Login User ID are not removed before the login request is sent. Although validation trims the value for checking, the submission handler sends the original untrimmed state, so an otherwise valid ID can be rejected.	1. Open the Patient Login modal. 2. Enter a valid Login User ID with an accidental leading or trailing space, for example ' patient123 '. 3. Enter the correct password. 4. Submit the login form and inspect the API payload.	The client should trim leading and trailing spaces from the Login User ID before submitting the authentication request.	The API payload contains the untrimmed identifier. The server may reject the request even though the user entered a valid ID apart from the extra spaces.
BUG-PL-004	Patient Login / Forgot Password	The Forgot Password view does not provide a direct way to return to the login form. Users who open it accidentally must close the entire dialog and restart navigation from the home page.	1. Open the Patient Login modal. 2. Click 'Forgot Password?'. 3. Look for a 'Back to Login' link or button.	The Forgot Password view should include a clear 'Back to Login' action or breadcrumb that returns directly to the login form.	No direct return-to-login action is available; users must close the dialog and start again from the home page.
BUG-002	Patient Signup	Informational and error alert modals show conflicting 'Yes' and 'Cancel' actions. These actions are unsuitable for simple notifications and make it unclear how the user should dismiss messages such as 'OTP has been sent' or 'Invalid OTP'.	1. Open the patient registration page. 2. Submit valid new signup details to trigger the OTP-sent notification. 3. Observe the modal buttons. 4. Enter an invalid OTP such as 000000 and click Verify OTP. 5. Observe the buttons on the invalid-OTP alert.	Informational and error alerts should provide a single clear action, such as 'OK' or 'Dismiss'. 'Yes' and 'Cancel' should be reserved for genuine confirmation decisions.	The alerts display both 'Yes' and 'Cancel', including on the OTP-sent notification and invalid-OTP error.
BUG-003	Patient Signup	An email address containing consecutive dots in its domain (for example, user@domain..com) passes client-side validation and triggers an unhandled backend HTTP 500 error instead of being rejected as invalid input.	1. Open the patient registration page. 2. Enter qa_test_user@gmail..com in the Email field. 3. Enter a valid 10-digit phone number. 4. Click Sign Up. 5. Inspect the network response and error alert.	The client-side validator should reject consecutive dots in the domain, or the API should return a controlled HTTP 400 Bad Request with a user-friendly validation message.	The email passes the client regex and the backend returns HTTP 500 with a generic API error.
BUG-004	Patient Signup	The promotional banner's 'SignUp For Now ↗' call-to-action links to /practice, sending patients to Practice/Doctor Onboarding instead of keeping them in the patient registration flow.	1. Open the patient registration page. 2. Locate the 'Experience The Future Of Healthcare' banner. 3. Click 'SignUp For Now ↗'.	The CTA should direct users to patient registration or otherwise preserve the patient signup context.	The CTA navigates to /practice, which is the Practice/Doctor Onboarding flow.

BUG-005	Patient Signup	The right-side carousel uses a full viewport height (100vh) while the registration form card is much shorter. This causes a large, visually unbalanced blank area beneath the form on desktop displays.	1. Open the patient registration page on a desktop viewport, such as 1440×900. 2. Compare the height of the form card with the right-side carousel. 3. Inspect the space below the form card.	The form card and carousel should have balanced heights and vertical alignment, without excessive empty space.	The carousel container uses h-screen (100vh) while the form card is approximately 350px tall, leaving about 500px of blank white space beneath the form on desktop.
BUG-008	Patient Signup	Submitting the signup form with both fields empty displays raw red asterisks as part of the validation messages, making the feedback visually untidy.	1. Open the patient registration page. 2. Leave Email and Phone Number empty. 3. Click Sign Up.	Validation messages should display clean, readable text such as 'Email is required' and 'Phone number is required', without stray punctuation.	The messages display as '* Email is required' and '* Phone number is required', with raw red asterisks.
BUG-PL-001	Patient Login / Signup dependency	Patient login end-to-end testing is blocked because the prerequisite signup OTP expires after 30 seconds. The account cannot complete Step 2 registration, so a valid patient account is not created for login testing.	1. Open the patient registration page. 2. Attempt to register a new patient using a valid email and phone number. 3. Wait for the OTP email and try to complete verification and detailed registration. 4. Attempt to log in with the newly registered account.	A patient should be able to complete signup, create an account, and then authenticate to access the Patient Dashboard.	The OTP expires before email delivery completes; detailed registration cannot be completed and no valid account is available for login. This is a dependent/repeated report of BUG-001.
BUG-PL-002	Patient Login / Authentication API	The POST /login authentication API includes internal Node.js stack-trace details in its HTTP 400 response. The response exposes server paths (such as /var/www/), internal function names, and implementation details to unauthenticated clients.	1. Submit a login request with invalid credentials. 2. Inspect the response body for POST /login in the browser network tools or API client. 3. Check whether internal stack-trace and server path details are returned.	Authentication failures should return a sanitized JSON response containing a status/success indicator and a friendly error message, without stack traces or internal infrastructure details.	The response body exposes a server stack trace, including an internal path similar to /var/www/ and backend function details.
BUG-PL-003	Patient Login	Leading and trailing spaces in the Login User ID are not removed before the login request is sent. Although validation trims the value for checking, the submission handler sends the original untrimmed state, so an otherwise valid ID can be rejected.	1. Open the Patient Login modal. 2. Enter a valid Login User ID with an accidental leading or trailing space, for example ' patient123 '. 3. Enter the correct password. 4. Submit the login form and inspect the API payload.	The client should trim leading and trailing spaces from the Login User ID before submitting the authentication request.	The API payload contains the untrimmed identifier. The server may reject the request even though the user entered a valid ID apart from the extra spaces.
BUG-PL-004	Patient Login / Forgot Password	The Forgot Password view does not provide a direct way to return to the login form. Users who open it accidentally must close the entire dialog and restart navigation from the home page.	1. Open the Patient Login modal. 2. Click 'Forgot Password?'. 3. Look for a 'Back to Login' link or button.	The Forgot Password view should include a clear 'Back to Login' action or breadcrumb that returns directly to the login form.	No direct return-to-login action is available; users must close the dialog and start again from the home page.
